

Dr. Kwon Video – Part 2

In my previous post, I mentioned that Dr. Kwon was a pioneer in dealing with oligometastatic prostate cancer.

December 14, 2021

Here's the second part of Dr. Kwon's video. Like the first video, it's very informative (perhaps even more so, at least for me).

Even though I had seen similar statistics before, one of the kickers for me is that only 33% of recurrent cancer is found in the prostate bed (local); 45% will be metastatic; and 22% will be both local and metastatic. As Dr. Kwon rightly points out, knowing where the cancer is located will guide your treatment decisions, and that's why I have been so reluctant to blindly step into salvage radiation therapy without having first identified the location of the cancer. Why risk the possible toxic side effects of radiation if you're not radiating in the correct location?

In my previous post, I mentioned that Dr. Kwon was a pioneer in dealing with oligometastatic prostate cancer. At the beginning, many in the profession dismissed his work out of hand (I'll admit I was skeptical, too), but it seems that over the last 10 years, his work has gained the respect of others and is supported by further research.

In any case, this video is 31 minutes long and I encourage you to watch it.
